6. **\*\*If needed, remove the dotted line so you can see the edges of the objects in the image\*\***. Next, type an object name in the text box and press Enter. Photoshop creates a copy of the original image in which the selected object is outlined. Next, type your new object name, select the Create new layer with name option from the Layer menu, and then delete the original layer. 7. **\*\*Click inside the newly created layer you just made and type the first letter of the object name\*\***. The letter creates a new layer, and now you can add text to the layer. Next, choose the type of text (such as bitmapped, vector, and so on). Then add the object name and type a new letter. Continue this process until you've created text for each letter of the word. Here, you type `_cape_`, and the next object is `_pants_`, which you type in the same way. You can also type the name of any shape or object you like. However, the letters have to be closely spaced for the letters to remain visible on the "box" created by the black line around the object, so you might need to carefully place the object names in the image. 8. **\*\*Repeat steps 6 and 7 to add text\*\***. Figure 6-10 shows the result. Figure 6-10. It can be hard to place text on an image. The text is represented by the dotted line here, which makes it look as if it belongs to another layer. To avoid that, you can begin by adding a layer (Layer → New → Layer). Then you can use the new layer to place the text precisely. You can also use the text layer to create a text mask. Next, you need to select the all the text and use the Text tool to change the color of the text and add a drop shadow. The text is displayed within the object created with the dotted line, so you can't select it directly. 9. **\*\*Click inside the bounding box and then select the Align option from the Layer menu\*\***. An alignment box appears at the top of the image. Grab the anchor points at the top of the box and drag them inward and upward. When you release the mouse button, the text appears to be aligned with the box. You can then drag the text to change its position. The box remains in the

Experimental and clinical studies on pyoderma gangrenosum: a review. Pyoderma gangrenosum is a chronic ulcerative disorder which is characterized by sterile ulcerations in the limbs, trunk and abdomen. Despite considerable progress in the understanding of the pathogenesis of pyoderma gangrenosum, its etiology and etiologic agent are unknown. This review addresses the clinical and experimental aspects of pyoderma gangrenosum as well as the most recent theories. Treatment modalities and implications are also discussed. As I often do in these types of articles, I am starting this out by going to some of the other story-telling tools available on the web. In this case I looked at grubbyleaks, and did some research on the history of the track. Although I can't find any evidence to put forth that Grubby was involved in the first recorded Skateboard races, I still believe that he was a pioneer in the sport. I just feel that he is more well known, since the term "Grubby" is a much more marketable name. People also know the origin of the word, which would not be the case with so many other early terms. I always feel that the art and history of skateboarding are somewhat larger in scope, because of its rise to fame and later popularity (and its centrality to the progression of surf culture). But nonetheless, I digress. The first skater to appear on "evidence" that would lead to an understanding of the origins of skateboarding was, supposedly, Jim Leedy. He was the original "skater" in the classic sense, where no one was sure of what he was riding. It was a board made out of plywood, with wheels attached. A large sign was stuck on the side that read "On it, Jim Leedy", and in case you were wondering, it was said that Leedy once won a race by 1/16 of a second. By the early 1930's there was a much greater understanding and awareness of skateboarding and skateboarders. The first skateboards were found being produced in the early 1930's. They had wheels attached to a piece of hardwood. One of the earliest skateboards was manufactured by the Wheel Company. The company was based in Los Angeles, with the number 51 stenciled on the deck. Many of the early

Up The Zen of Python Python is built around 3 fundamental principles: Readability, Close-to-the-machine programming style, and Dynamically typed, fast, interpreted, and friendly to beginners. Most of the language's power lies in its built-in data model. A text editor might display everything in files, with each file associated with a unique filename. This is just a view. The Python data model is very different: everything is an object. Python is dynamically typed, which means you can mix and match data types. An array is just a sequence of objects. The language emphasizes several other features. Loosely-typed: Types are flexible, and support polymorphism Modules: You can write your program as a single file, Django: Django is a Python web framework, and the default view is a simple list: 

```
>>> from django.shortcuts import render >>> def index(): >>> return render('index.html')
```

 >>> Python is fast, which also leads to fewer bugs, Multiple inheritance: Python supports multiple inheritance, which is really useful, Wildcards: Wildcards are an incredibly useful feature, Built-in namespaces: This lets you avoid having to create your own "module" namespace, Two-way data binding: Python 2.5 added support for a powerful feature called two-way data binding, Django supports all of these features, and more! You'll find a guide to
