Field of the Invention The present invention relates to information search, and more particularly to a method for automatically searching electronic documents based on keywords stored in a first document and then automatically locating the keyword from the first document in a second document, where the second document is a table of the first document. 2. Description of the Related Art A number of systems are available for searching for information in database files. Typically, these systems involve use of a search engine, where the user enters a search query. A search engine typically accepts search terms or keywords as inputs, and searches a database for matches to the query. The database may be a relational database or a flat-file database, such as a text file or a structured query language (SQL) database. In the case of a SQL database, a relational query is built in the language that is run against the database. The search results may be presented in the form of a table, a graphical user interface (GUI) screen, etc. The user is able to limit the search to a particular area of the database by specifying a range of keywords in the search query. The range may be a subset of the full set of keywords, or it may be an inclusive range. A range is used to narrow the search to a specific area of the database. For example, a range may be specified by an inclusive lower and an exclusive upper bound. The inclusive bound is the keyword

Markup Assist helps you to quickly incorporate changes you've made in AutoCAD, such as editing comments or revising dimensions, into your design. The changes you make will be incorporated into the drawing that you're working on. We know you're not just interested in importing and editing your markups in the field of use. We want to make sure you get the most out of the tools you use to create and manage your drawings, including the commands that set you free. Point Drafting now automatically extracts the height of the tallest object in a layer, making it easier for you to create smooth, realistic looking, three-dimensional (3D) models. The new draft tool automatically shapes raster images. Drafting and 3D Modeling tools allow you to quickly transform 2D shapes into 3D objects. Now, you can snap the middle points of two adjacent sides of a rectangular face. This allows you to accurately align two edges for more efficient drawing and modeling. To help you maintain a consistent drawing scale throughout the entire CAD environment, you can now change the scale for all open drawings in the DesignCenter using the DesignCenter Scale tool. Redesign documents in a single click, without the need to close the file first. Now, you can double-click any file to open it in the drawing environment. Viewing drawings in a Designer Layout tab. Designer Layout tabs give you a consistent view of your drawings regardless of which tab is open. You can also add tab frames and different information to a tab.
