Graphics The AutoCAD Graphics Language (AGL) provides a system for describing drawings by means of data structures, as well as a set of commands to create, move, rotate, scale, shade, etc. These commands are mapped to drawing-specific events. This system is also extended with two more low-level languages, the Graphic Language for Classes (GL-Class) and Graphic Language for Structures (GL-Struc). The idea of these languages is to make it easier to create and modify parts of the drawing. AGL was developed by John Coggeshall at the Open Systems Division of Autodesk from the early 1980s, and first released as a commercial product in 1991. Terrain tools The Terrain tools allow creating complex 3D terrain models from various CAD data sources. AutoCAD's native Terrain tools were initially released in AutoCAD 2000. In 2007, Autodesk released the Terrain tools as free-to-use products for AutoCAD LT, AutoCAD Architectural Desktop, AutoCAD MEP, AutoCAD Map 3D and AutoCAD Civil 3D. AutoCAD provides a number of methods to create 3D and 2D topology and create a mesh based on it. Powerful editing and validation tools are available for meshes. The tools for editing are applicable for editable objects only. This is limited to geometric objects (meshes, surfaces, solids, polylines, polylithics, free-hand traces and points) while the validation tools are applicable for all the objects. Mesh tools provide an efficient tool to create 3D or 2D meshes from a variety of sources such as CAD models, digital scans, photo-realistic textures and solids. Mesh editing is done through the Edit Mesh toolbox, which includes a number of tools such as cut mesh, copy mesh, align mesh and set mesh attributes. The mesh editing is only available for editable objects. The validation tools are only applicable to the 2D and 3D mesh objects. Mesh tools have the following major components: Open a document containing a variety of geometric objects and surfaces Edit (Cut, Copy, Align, Join, Set Attributes) one or more objects. Validate the edited object by using the Mesh Tools Validation Suite. Create a 2D or 3D mesh based on the edited object See also References Further reading ca3bfb1094

Q: How to call a function inside a function with innerFunction I want to call a function inside a function where it looks like the function inside function is called with other function inside this function. function b() { function a(x) { console.log(x); function c() { console.log("inside a"); console.log(x); console.log("inside c"); } c(); } a(1); } b(); I expect the output as: inside a 1 inside a 1 inside c inside c 1 But instead i get output as : inside a 1 inside a 1 inside c inside c A: If we are trying to do functional programming and to use the "closures" we have to understand the scope of a given function. A function declared inside another function has access only to that function's local variables and functions that are declared in the same scope. function a(x) { function c() { console.log("inside a"); console.log(x); console.log("inside c"); } c(); } a(1); This example, when given will give us an output of inside a 1 If we modify the code to this, it will output what you want function a(x) { function c() { console.log("inside a"); console.log(x); console.log("inside c"); } c(); } a(1)(); We can see that the second (
