Romo said he's going to continue playing this season — even though he's being paid \$30 million by the team to not play. "I know they're looking for me to sit down and take a year off, but I don't think that's something we're going to be doing," Romo said, via the Fort Worth Star-Telegram. "This is something that I'm going to continue to try to play, and I'm going to make it work so that we can move into the next week and we can get ready for the playoffs." Romo, of course, remains eligible to play for Dallas in the playoffs if the Cowboys go there, since he had been injured and was unable to play the final two regular-season games. But that still leaves his future status in Dallas up in the air, as the Cowboys are now working on a long-term contract extension for him. They couldn't afford the luxury of giving him a year off this year, so instead they're paying him more to not play.Exchange bias and a high magnetic-field-induced magnetization in a Ni(1/2)NbS(2) compound. A Ni(1/2)NbS(2) compound behaves in some cases as a spin glass at low temperature. Here we report a magnetic phase transition from a glassy state with exchange bias to a high-field magnetic ordered state. Exchange bias is evident in the usual low

Sindbis virus Download Demo video 2019Q: RxJava: Do I have to call onComplete() and onError() in the Observable.zip() collector method? Usually, I'd use Observable.zip() as follows: Observable first = Observable.range(0, 10); Observable second = Observable.range(10, 20); Observable result = first.zip(second, (firstInt, secondInt) -> { System.out.println("firstInt: " + firstInt + ", secondInt: " + secondInt); return firstInt + secondInt; }); result.subscribe(...) Now I want to know if this is really necessary: Observable result = first.zip(second, (firstInt, secondInt) -> { System.out.println("firstInt: " + firstInt + ", secondInt: " + secondInt); return firstInt + secondInt; }, (e1, e2) -> { System.out.println("Error-1: " + e1); }, () -> { System.out.println("Completed!"); }); Since all zip() does is to wrap the first and second Observables into one Observable by calling Observable.zip(this, that,...). Also, from my research on Observable.zip(...), it seems this is unnecessary: Observable

```
result = Observable.zip( first, second, (firstInt, secondInt) -> { System.out.println("firstInt: " + firstInt
+ ", secondInt: " + secondInt); return firstInt + secondInt; }, (e1, e2) -> {
    System.out.println("Error-1: " + e1);
```
