Software Engineering CAD databases are also important as they are used in CAD systems for storing design data and maintaining the integrity of that data. As CAD systems become more complex, the tools to create them have also become more complex. The design software must be able to handle the complexity of the data to be used by the CAD system. A CAD database is a database that stores CAD file information. CAD databases typically store CAD model and drawing information (design intent), design rules, and architectural information. CAD databases store design information in a relational database. Data fields stored in CAD databases may include the type of object stored (line, section, plane), the position of the object (x, y, z), the dimensions of the object, all views of the object, properties such as color, material, marking, and/or other optional properties. CAD databases may also store information related to materials, such as a database with properties for the hardness of concrete. 3D CAD software uses the coordinate system for a work plane or "Z" axis, the origin is defined in the plane. This allows the designer to see the height of the objects, which can be useful for seeing through complex building structures. The software creates 3D objects, which can be sectioned and sliced to allow complex pieces of geometry to be seen from different views. 3D CAD systems may be classified as either parametric or model-based. Parametric CAD systems create objects by placing points, lines, and planes. It is the most commonly used method. The other method, model-based, allows the designer to create complex objects by grouping simple geometric shapes and thereby reducing the complexity of 3D objects. A simple example is using geometry to represent the limbs of a cat. This is easier than trying to represent the complex shape of a cat with a 3D CAD program. 3D modelling 3D CAD software is used to create 3D models for a wide variety of applications. A 3D model may be created from a 2D drawing, a scan, or as a combination of the two. If a CAD model is created from a 2D drawing, it is sometimes called a digital model. For example, the software may be used for creating mock-ups and technical drawings. It may be used to help visualize what may be achieved with a design. It may be used to create construction drawings of a building. It may be used to create models for games such as construction kits and

On the welcome screen, select “Autodesk AutoCAD 2017, 2017 Enterprise or 2017 Ultimate”. Search “Online Activation Code” or “Logon Code” for the license that will be activated (the licence will appear on the right-hand side of the page). You can also download the license directly from this page. A window will pop up asking for your license key. Paste the license key and click OK. You are all set. This application is a national stage of international application PCT/JPO0/01897 filed Feb. 6, 2000. The present invention relates to a nano-size particle high-concentration mixing material which is high in dispersion ability and which can uniformly disperse the nano-size particle in water and a dispersion medium and form a homogeneous suspension and a method of producing the same. With progress in the molecular biology and biotechnology in recent years, development of a high-performance sensor and an image capturing device for analyzing samples with DNA, RNA and protein chips, ultrafine particles and colloidal particles has been desired. As the methods of producing the nano-size particle high-concentration mixing materials, an ultrasonic dispersion method, a heating-jetting dispersion method, a spray-jetting dispersion method, a pulverization method, a roller compounding method and the like have been reported. Further, as the nano-size particle high-concentration mixing materials, those which are produced by mixing nano-size particles with a high concentration have been reported. An ultrasonic dispersion method is as follows. An organic solvent having a low boiling point is added to a nano-size particle material in a powder form and a dispersion medium to which an ultrasonic wave is applied to the nano-size particle material and the dispersion medium is mixed. A heating-jetting dispersion method is as follows. A nano-size particle material in a powder form is mixed in a dispersion medium, which is heated to a temperature higher than the melting point of the nano-size particle material to melt the nano-size particle material. Then, the dispersion medium is ultrasonically jetted to disperse the nano-size particle material. A spray-jetting dispersion method is as follows. An aqueous dispersion medium containing a nano-size particle material in a powder form is sprayed to the atmosphere to atomize the nano-size particle material and the
